       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DB

New non-haemolytic cytolytic agent useful in treating cancer infections - is a peptide comprising a moiety which disrupts continuity of an alpha-helical structure

or

Claim 14;

Page

106; 126pp; English.

present peptide is used to produce the agents of the invention.

non-haemolytic,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC specification describes a non-haemolytic, cytolytic agent, which is a complex of bundled peptides, a mixture of peptides or a random complex of bundled peptides, a mixture of peptides or a random complex of peptide copolymer. The agent has a selective cytolytic activity on comparison that a selected from a cytolic derivative of a peptide which has a net positive charge greater than 1, comprises I-amino acid residues and comprises an alpha-helix comprises I-amino acid residues and comprises an alpha-helix comprises I-amino acid residues and comprises an alpha-helix comprises I-amino acid residues and I-amino acid residues, has a net consitive charge greater than 1 and has an amino acid sequence such that a corresponding amino acid sequence comprising only I-amino acid residues a corresponding amino acid sequence comprising only I-amino acid residues a corresponding bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be used as disinfectants for destruction of microorganisms, i.e. in the comprision of proposery at the comprision of compresery actives in the constraints productes or compresery actives and compreservatives and compresery actives and compreservatives and compres
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

specification describes a non-haemolytic, peptide, a complex of bundled peptides, a

The present peptide is used to produce the agents of the invention. The specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/or D-amino acid residues and comprises an alpha-helix breaker molety, or a peptide (or cyclic derivative of this) which

The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be solutions for wetting contact lenses, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.

The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be used as disinfectants for destruction of microorganisms, i.e. in solutions for wetting contact lenses, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or bactericides) or for preservation of agricultural products.
specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-amino acid residues and/or D-amino acid residues and comprises an alpha-helix (comprises L-amino acid residues and D-amino acid residues, has a net positive charge greater than 1 and has an amino acid sequence such that a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The cytolytic agents may be used for treatment of several diseases caused by pathogens,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                including bacterial, fungal, viral, mycoplasma and protozoan. They may be used in both human and veterinary medicine. They used as disinfectants for destruction of microorganisms, i.e. solutions for wetting contact lenses, as preservatives, e.g., cosmetic and food industries, as pesticides (e.g. fungicides of the company of the compan
This sequence represents a diastereomer peptide of the invention. This sequence is used in a "bundle sequence", which is created by binding copies of this sequence to peptide 23 (see AAW35149). The peptides of the invention have: (a) cytolytic activity on pathogenic cells (pathogand malignant cells not naturally present in the body); but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse pathogens. The

Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as agricultural pesticides. The absence of haemolytic activity (associated with disturbance of alpha-helical structures) means that the peptides have few if any toxic effects, and those that include D-aa will have increased resistance to proteolytic degradation. Non-haemolytic, cytotoxic random copolymers of pardaxin, each has a specific spectrum of activity, allowing selection of agents for particular applications. Since these random copolymers induce total lysis of bacterial cell walls, resistance
The present invention describes composition of matter (1) comprising Fc domain, pharmacologically active peptides, and linkers. Where (1) (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L4)f-P4 (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each
                                                                                                                      Claim 39; Page 401; 608pp; English.

The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC copies of this sequence to peptide 26 (see AAW35152). The peptides of CC the invention have: (a) cytolytic activity on pathogenic cells (pathogens CC and malignant cells not naturally present in the body); but (b) no CC haemolytic activity, or such activity only at a concentration CC significantly higher than that at which they lyse pathogens. The CC peptides, their complexes and mixtures are used to treat infections CC (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, CC in human and veterinary medicine. Also, they can be used as preservatives CC for food, cosmetics and agricultural produce, or as agricultural produce, or as agricultural CC pesticides. The absence of haemolytic activity (associated with CC disturbance of alpha-helical structures) means that the peptides have few CC if any toxic effects, and those that include D-ra will have increased CC resistance to proteolytic degradation. Non-haemolytic, cytotoxic random CC copolymers of pardaxin, each has a specific spectrum of activity, CC random copolymers induce total lysis of bacterial cell walls, resistance of habital values to favenian applications. Since these

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC This sequence represents a Leu/Lys diastereomer peptide of the Ci invention. The peptides of the invention have: (a) cytolytic activity on CC pathogenic cells (pathogens and malignant cells not naturally present in CC the body); but (b) no haemolytic activity, or such activity only at a CC concentration significantly higher than that at which they lyse CC pathogens. The peptides, their complexes and mixtures are used to treat CC infections (caused by bacteria, fungl, protozoa, mycoplasma or viruses) CC or cancer, in human and veterinary medicine. Also, they can be used as CC gricultural pesticides. The absence of haemolytic activity (associated CC with disturbance of alpha-helical structures) means that the peptides CC have few if any toxic effects, and those that include D-aa will have CC increased resistance to proteolytic degradation. Non-haemolytic, CC cytotoxic random copolymers of pardaxin, each has a specific spectrum of CC cutivity, allowing selection of agents for particular applications. Since CC these random copolymers induce total lysis of bacterial cell walls, xxx

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a Leu/Lys diastereomer peptide of the invention. The peptides of the invention have: (a) cytolytic activity on the body); but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse can be peptides, their complexes and mixtures are used to treat infections (caused by bacteria, fungi, protozoa, mycoplasma or viruses) cor cancer, in human and veterinary medicine. Also, they can be used as preservatives for food, cosmetics and agricultural produce, or as capricultural pesticides. The absence of haemolytic activity (associated with disturbance of alpha-helical structures) means that the peptides capricuses of resistance to proteolytic degradation. Non-haemolytic, correased resistance to proteolytic degradation. Non-haemolytic, corresistance to proteolytic degradation as specific spectrum of correct capricultity, allowing selection of agents for particular applications. Since these random copolymers induce total lysis of bacterial cell walls, very constance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                           Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC The present peptide is used to produce the agents of the invention. The CC specification describes a non-haemolytic, cytolytic agent, which is a CC peptide, a complex of bundled peptides, a mixture of peptides or a random CC peptide copolymer. The agent has a selective cytolytic activity on CC pathogenic cells. The agent is selected from a cyclic derivative of a CC peptide which has a net positive charge greater than 1, comprises L-amino acid residues and comprises an alpha-helix CC comprises 1.-amino acid residues and comprises an alpha-helix CC comprises L-amino acid residues and D-amino acid residues, has a net CC comprises L-amino acid residues and D-amino acid sequence such that a corresponding amino acid sequence comprising only L-amino acid residues is not found in nature. The crolytric agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, CC cancer or for treatment of several diseases caused by pathogens. They may be used in both human and veterinary medicine. They may also be used in both human and veterinary medicine. They may also be

The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, including bacterial, fungal, viral, mycoplasma and protozoan infections. They may be used in both human and veterinary medicine. They may also be used as disinfectants for destruction of microorganisms, i.e. in solutions for wetting contact lenses, as preservatives, e.g., in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                acid residues and/or D-amino acid residues and comprises an alpha-helix breaker moiety, or a peptide (or cyclic derivative of this) which (comprises L-amino acid residues and D-amino acid residues, has a net positive charge greater than 1 and has an amino acid sequence such that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      specification describes a non-haemolytic, cytolytic agent, which is a peptide, a complex of bundled peptides, a mixture of peptides or a random peptide copolymer. The agent has a selective cytolytic activity on pathogenic cells. The agent is selected from a cyclic derivative of a peptide which has a net positive charge greater than 1, comprises L-mino peptide which has a net positive charge greater than 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New non-haemolytic cytolytic agent useful in treating cancer or infections - is a peptide comprising a moiety which disrupts the continuity of an alpha-helical structure
                                                                                                                                                                                                                                                                                               W09837090-A1
                                                                                                                                                                                                                                                                                                                                Synthetic
                                                                                                                                                                                                                                                                                                                                                             Non-haemolytic; cytolytic; selective cytolytic activity; pathogen; cancer; infection; disinfectant; contact lens wetting solution; preservative; pesticide; fungicide; bactericide.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Antipathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        19-MAY-1999

The agent has a selective cytolytic activity on cpeptide which has a net positive charge greater than 1, comprises L-amino cc peptide which has a net positive charge greater than 1, comprises L-amino cc peptide which has a net positive charge greater than 1, comprises L-amino cc peptide which has a net positive charge greater than 1, comprises L-amino cc peptide (or cyclic derivative of this) which cc (comprises L-amino acid residues and comprises an alpha-helix cc (comprises L-amino acid residues and latino acid residues, has a net cc positive charge greater than 1 and has an amino acid sequence such that cc is not found in nature. The cytolytic agents may be used for treatment of cancer or for treatment of several diseases caused by pathogens, cc including bacterial, fungal, viral, mycoplasma and protozoan infections. Cc used as disinfectants for destruction of microorganisms, i.e. in the

CC The present invention describes composition of matter (I) comprising an CC (X1)a-FI-(X2)b, where: FI = an Fc domain; X1 and X2 = aech CC (X1)a-FI-(X2)b, where: FI = an Fc domain; X1 and X2 = aech CC independently selected from -(L1)c-P1 -(L1)c-P1-(L2)d-P2, CC (L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P3, or '(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4-(CC where P1, P2, P3, and P4 = are each independently sequences of CC pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently composition can CC have cytostatic, antiasthmatic, thrombollytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can CC be used for producing pharmaceutical compositions. The compositions are CC useful for treating cancer, asthma, thrombosis, or attoimmune diseases. CC The use of an Fc domain (rather than a Fab domain) can provide a longer that f-ife or incorporate functions such as Fc receptor binding, protein CC Abinding, complement fixation, and possibly placental transfer. AAA69443 CC to AAA6926 and AAB1695 to AAB18003 represent nucleotide and amino acid vy
